

# Left Recursion, Left Factoring, FIRST, FOLLOW

March 10, 2025

# Left Recursion

**Definition:** Left recursion occurs when a non-terminal references itself as the first symbol in its production.

## Drawback in LL(1) Parsing:

- ▶ LL(1) parsers rely on a single token lookahead, and left recursion leads to infinite recursion, making parsing impossible.
- ▶ Must be eliminated for LL(1) grammar.

## Example (Left Recursive Grammar):

$$A \rightarrow A\alpha \mid \beta$$

## Removing Left Recursion:

$$\begin{aligned} A &\rightarrow \beta A' \\ A' &\rightarrow \alpha A' \mid \varepsilon \end{aligned}$$

# Left Factoring

**Definition:** Left factoring is used when a grammar has two or more productions that share a common prefix.

## Drawback in LL(1) Parsing:

- ▶ LL(1) parsers require a single unique lookahead token to decide the production.
- ▶ If multiple productions share a common prefix, the parser cannot determine which rule to apply.

## Example (Before Left Factoring):

$$A \rightarrow \alpha\beta \mid \alpha\gamma$$

## After Left Factoring:

$$\begin{aligned} A &\rightarrow \alpha A' \\ A' &\rightarrow \beta \mid \gamma \end{aligned}$$

# FIRST Set Definition and Rules

**FIRST(A):** The set of terminals that can appear at the start of any string derived from **A**. If **A** can derive  $\varepsilon$ , include  $\varepsilon$  in FIRST(A).

## Rules:

- ▶ If **A** is a terminal,  $\text{FIRST}(A) = \{A\}$ .
- ▶ If  $\mathbf{A} \rightarrow \varepsilon$ , then  $\varepsilon \in \text{FIRST}(A)$ .
- ▶ If  $\mathbf{A} \rightarrow X_1 X_2 \dots X_n$ :
  - ▶ Add  $\text{FIRST}(X_1)$  (excluding  $\varepsilon$ ) to  $\text{FIRST}(A)$ .
  - ▶ If  $X_1$  can derive  $\varepsilon$ , check  $X_2$ , and so on.
  - ▶ If all  $X_i$  can derive  $\varepsilon$ , add  $\varepsilon$  to  $\text{FIRST}(A)$ .

# Example for FIRST Set

**Grammar:**

$$A \rightarrow aB \mid \varepsilon$$

$$B \rightarrow b \mid c$$

**FIRST Sets:**

- ▶  $\text{FIRST}(A) = \{ a, \varepsilon \}$
- ▶  $\text{FIRST}(B) = \{ b, c \}$

# FOLLOW Set Definition and Rules

**FOLLOW(A):** The set of terminals that can appear immediately after **A** in some derivation.

**Rules:**

- ▶ If **S** is the start symbol, FOLLOW(S) includes \$.
- ▶ If  $\mathbf{A} \rightarrow \alpha B \beta$ , then:
  - ▶ Add FIRST( $\beta$ ) (excluding  $\varepsilon$ ) to FOLLOW(B).
  - ▶ If  $\beta$  can derive  $\varepsilon$ , add FOLLOW(A) to FOLLOW(B).
- ▶ If  $\mathbf{A} \rightarrow \alpha B$ , then FOLLOW(B) includes FOLLOW(A).

# Example for FOLLOW Set

## Grammar:

$$S \rightarrow AB$$

$$A \rightarrow a \mid \varepsilon$$

$$B \rightarrow b$$

## FOLLOW Sets:

- ▶  $\text{FOLLOW}(S) = \{ \$ \}$
- ▶  $\text{FOLLOW}(A) = \{ b \}$
- ▶  $\text{FOLLOW}(B) = \{ \$ \}$
